AT A GLANCE

### Well-structured hit-lists

Hit-lists which are too extensive or not well sorted do not constitute a big help. With its comprehensive options for the ranking and sorting of search results, Infopark Search Cartridge avoids this. Thus, the search may be limited to files within a certain publishing or editing period or to files which contain all search terms within one paragraph.

Due to sorting possibilities according to file type, relevance or date a high quality hit-list is guaranteed. This is how the very first request leads to the required result.

Infopark Search Cartridge provides well-structured hit-lists

### Support of various file formats

Infopark Search Cartridge supports all types of files with contents in text format or contents which are convertible into text format (HTML and XML-files, PDF, Office files and more). Due to UTF-8-support, non-Latin fonts may be indexed, as well.

The processing of proprietary file formats ensures that information from previous database do not get lost. Special filters ensure that even file formats which are hard to grasp (for instance databases or spreadsheets) can be integrated into the search.
